GALATIQ × SPACEXSI GROK BOT HACKATHON · AUSTIN

Portal Autopilot

Every “log in to view” email, handled.

Track 1 · Rebuild a tool you pay for

Built on Grok Bot

Three Grok Bots: Sentry vets the email. Clerk does the portal work. Concierge answers from Clerk's facts in Adapter Mind.

THE PROBLEM

Alex has 12 portals. Every one emails: “Log in to view.”

So bills go unchecked, deadlines slip, and a fake email is one click away.

LIVE DEMO

Watch three emails arrive

1 A fake bank email: blocked, never clicked

2 A hospital statement: filed and checked against the insurer

3 A dispute: sent only after Alex approves

What it caught

THE ATTACKS

Two attacks, both stopped

- A look-alike bank email: quarantined, link never opened
- A bank message telling AI agents to change the payee: reported, ignored

Text inside portals is data, never instructions.

THE MONEY

$372

you don’t owe: billed $412, the insurer says $40.

Plus a $412 autopay flagged before it goes out, an MRI denial the hospital’s own record disproves (PA-55120), and a $180 bill never sent to insurance.

The hospital, insurer and bank portals and their data are fictional, staged for the demo.

HOW IT WORKS

The bot reads and clicks. Code decides. You approve.

Bots read and click

Sentry vets email without clicking. Clerk opens the real portal.

Code decides

Tested Python checks the email and matches bill to EOB.

Mind remembers

Adapter Mind keeps every document and deadline, with sources.

You approve

Anything that leaves waits for your yes.

Anti-jobs, the way Grok Bot’s community writes them: Sentry never opens an emailed link. Clerk never types a password, never changes a payment, and never sends without your yes.

WHY GROK BOT

Not a better model. The runtime around one.

Stays signed in

One takeover login. The bot never sees the password.

The browser is the API

Portals have no API. Clerk reads them on its own computer.

Always on

Gmail trigger and a 7 AM routine, laptop closed.

Handoffs and approvals

Sentry hands off to Clerk. Disputes wait for your yes.

With a typical agent framework we’d build the hosted browser, persistent logins, 2FA handoff, triggers and approvals ourselves. Grok Bot ships them.

WHAT'S NEXT

Every portal, and every agent

- Per-agent read permissions on your Adapter Mind
- Learn a new portal from one forwarded email
- A nightly check of portals that never email

Your inbox says "log in to view." Portal Autopilot logs in, reads it, and catches what you don't owe.

Thank you. Questions?
